Problem :- Many people who use washing machine constantly face wear and tear of their clothes and the torn threads may lead to clogging and wasting of water which does not help many parents

Solution :- I have an Idea of inventing an AI washing machine where the threads torn from the clothes get stored in a small storage where it gets steam dried and pressure is applied on them to create like small blocks which can be used as stuffings for pillows. Many people think it uses a lot of water but I have an idea of using only 2 glass of Tap water per use so it helps in saving water
