Idea:- Useful app on a mini gadget with camera access which help students and IT employes working at day or night.
Endusers

Problem:- As we seen students who are attending competitive exams and school exams they have to read night and they are reading while they are reading they are going to sleep.

② We see that IT employes work at day and night. So, they are not at all okay and lack of sleep may lead them to sleep and because of stress also. In the important work or meeting if the happens they may be fined.

③ We see some students and Adults are facing allergies and pimples in their face because they are touching their face with their hand, which leads to some problems in face.

Solution:- As before I said I am going to make it using some script (code) on a gadget.

① App:- So, I am going to build a app using some script (code) As it works like when a student or IT employe are going to sleep like their sitting 90° and by mistake if they get sleep like bending without knowing. We can teach or feed the app about it and make that in the app the sensors take it they are not touching their face. And when they sleep or sleep or touch they make app is going to give them warning, and build it like a friend ex:- how interactive the device

② Prototype(gadget):- Same like app with camera it can be accessed by the customer for their personal and build it like a friend
