Problems: In any public places or hostels, schools the water aquaguard are installed but sometimes the insects, lizards etc may fall into the aquaguard and enter inside into the water. This will cause health problems to people who will drink it. And sometimes when aquaguards are not cleaned for many days the algaes will be formed. This will again cause health issues.

Solutions: When an insect falls into the aquaguard, the indicators should be installed to the water aquaguard This helps in indicating that an insect or an algae is formed. An opener should be done at the backside of it. When the indicator makes sound the water will flow out from the backside and clean itself. After drawing out water & cleaning the water can refill itself. This helps in decreasing the health issues.

Problem: Water purifiers in public places and schools risk contamination when insects or lizards fall inside or when uncleaned units

Solution: An automated indicator system paired with a rear-drainage mechanism can detect impurities trigger self-flushing, safely refill the purified to ensure clean drinking water
